

ABSTRACT OF THE DISCLOSURESTABILIZER FOR A ROD, PARTICULARLY A STRING OF DRILLING RODS

Stabilizer (1) designed to be slid onto a rod (2), particularly a string of drilling rods. It comprises at least one elastic part (4) that can deform when the stabilizer (1) is held in an initial position in compression against a shoulder (5) of the rod (2), this elastic part (4) compensating for play that may appear later between the  
5 stabilizer (1) and the rod (2).

Application particularly to drilling for oil wells.
